Research Interests

I am interested in foundational aspects of **generalization in machine learning**. My research goal is to advance our scientific and mathematical understanding of deep learning and leverage these fundamental insights to design practical algorithms. I particularly care about ensuring robustness, grounding, and trustworthiness of large models in multimodal and interactive domains. My current focus includes:

- Generalization theory of neural networks and feature learning
- Robustness under distribution shift, task shift, and spurious correlations
- Foundations and applications of large-scale multimodal vision-language models

I also enjoy applying my work to challenging industry-scale research problems. During my PhD, I interned at Google and Microsoft Research (twice), where I most recently worked on development of a 15B multimodal vision-language model with application to computer-use agents.
